

Ship to the World

**It stops being a thing on your laptop
and becomes a link you can send.**

Hosted Postgres, a public dashboard, and a scheduled job that wakes up every morning on a computer you don't own. Everything except the words “live” and “public” is already true — that's today.

The deploy is easy because you designed for it in week one.

RULE 2 · FOUR WEEKS AGO

.kiro/steering/edgedash.md — written in SESSION ONE

2. ALL storage access goes through a single storage module.

No other module may import sqlite3 directly.

**We will swap SQLite for hosted Postgres in week 4
and it must be a one-file change.**

Least interesting rule in the file. In four minutes it either pays off or it doesn't — and if it doesn't, you find out exactly which file leaked, which is more useful than a clean deploy.

Four things today: a real database, a public dashboard, a scheduled job, and **a URL you can put in a job application.**

What you built today

- 1 **Hosted Postgres** — swapped in one file, because of a rule from session one.
- 2 A **public dashboard** that renders honestly when data is empty or stale.
- 3 A **scheduled job** that runs on someone else's computer every morning.
- 4 And a **URL you can send to a stranger**.

Your laptop is no longer part of the system. **Trigger, orchestrator, sub-agents, verifier, storage, dashboard** — all of it running without you.

The one that goes in your portfolio.

Must be true

- 1 Live public URL, working
- 2 Hosted Postgres, **not** SQLite
- 3 One automated cycle you **didn't trigger**
- 4 .env never committed

The 60–90 sec demo · 4 shots

- 1 Your live URL loading
- 2 Ask a question — answer **and rows**
- 3 The gap panel, your real top gap
- 4 The activity log **with a rejection in it**

AND A README WITH A “WHY” SECTION

Why storage sits behind one module. Why the model never writes SQL. Anyone can generate this project — **explaining the decisions is the part that doesn't come free.**

The Edge

For the builder whose career intelligence went public — a live, autonomous dashboard that scores the market and surfaces skill gaps every morning without them.

The Tracker ✓ · **The Decoder** ✓ · **The Automator** ✓ · **The Edge** ✓

All four plus a verified public ship → certificate. **And the certificate is the least valuable thing you're leaving with.**

Bring your URL.

[day, date · time] — I deploy the complete thing on stream, end to end, no cuts. Then two or three of you demo your own live dashboards.

BRING IT EVEN IF IT'S ROUGH

Especially if it's rough. The person whose deploy half-works and who can explain **exactly which half** is more interesting to listen to than a polished one.

Certificates go to everyone with verified assignment links across all four weeks. Peer showcase, open floor, and whatever you're still stuck on.

ONE LAST THING

You can explain every line of it.

Four weeks ago you had a browser tab and a vague sense you were behind. Eleven days behind — that was the number I opened with. Now there's a URL that wakes at six, reads your market, scores every listing, works out what it's costing you, checks its own work, and refuses to publish when it doesn't trust itself.

AND THAT LAST PART IS THE ONE THAT MATTERS

Plenty of people can generate a project like this. Far fewer can tell you **why the storage sits behind one module**, or why the model never writes the SQL.

Post your link. #MyEdge. Thank you for spending the month with me.

SEE YOU AT THE LIVE SESSION
